# Optical Modulation Schemes

## Background Theory and Formulation of the Module

### Dual Drive Mach-Zehnder Modulators

Mach-Zehnder modulator (MZM) consists of two arms, as shown in Fig. 1.

Voltages  $V_1$  and  $V_2$  are applied to the upper and lower arms, respectively. Let the electric field of the

**Figure 1.** A dual drive mach-zehnder modulator.

input optical beam be,

$$\psi_{\text{int}} = A_0 \exp(-i2\pi f_c t) \quad (1)$$

where  $f_c$  is the frequency of the optical carrier and  $A_0$  is the input amplitude. The output amplitude of the modulator is,

$$A_{out} = A_0 \cos \left\{ \left[ m(t) - \frac{V_{bias}}{2} \right] \frac{\pi}{V_\pi} \right\} \quad (2)$$

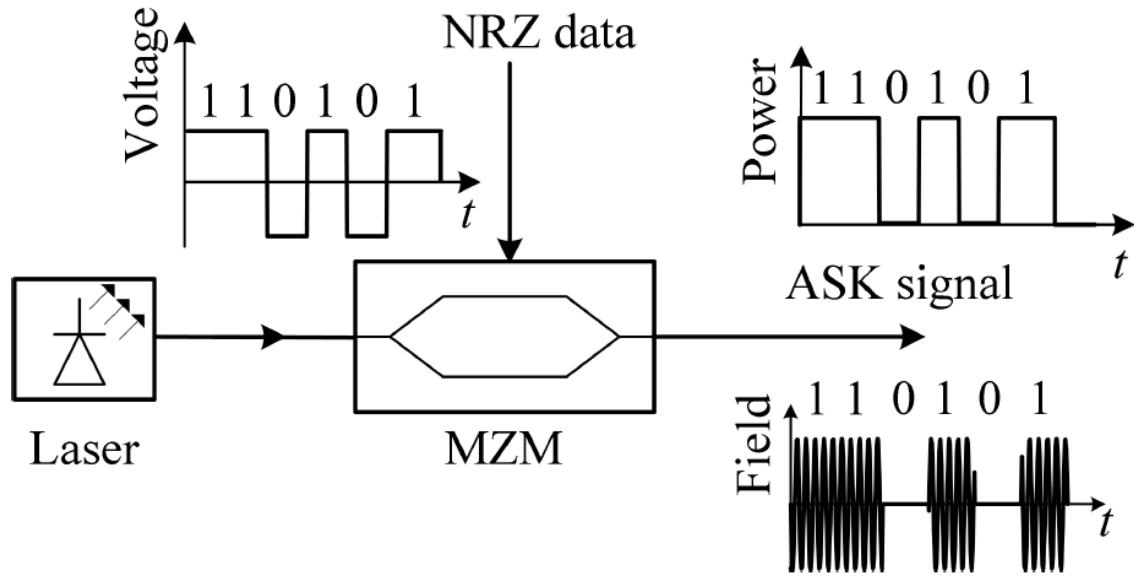

where  $m(t)$  is the message signal,  $V_{bias}$  is the constant bias voltage and  $V_\pi$  is the switching voltage. The power output is,

$$P_{out} = P_0 \cos^2 \left\{ \left[ m(t) - \frac{V_{bias}}{2} \right] \frac{\pi}{V_\pi} \right\} \quad (3)$$

where  $P_0 = A_0^2$ .

## Optical Realization of Modulation Schemes

The optical ASK signal can be generated using a Mach-Zehnder modulator (MZM), as shown in Fig. 2. The optical power of the MZM output may be written as (Eq. (3)),

**Figure 2.** Generation of ASK signal using a MZM.

$$P_{out} = P_0 \cos^2 \left[ \frac{m(t)\pi}{V_\pi} - \frac{V_{bias}\pi}{2V_\pi} \right]. \quad (4)$$

Let the message signal be a polar NRZ,

$$m(t) = \begin{cases} +V & \text{for bit '1'} \\ -V & \text{for bit '0'} \end{cases} \quad (5)$$

The desired Mach-Zehnder output power is,

$$P_{out} = \begin{cases} P_{out} & \text{for bit '1'} \\ 0 & \text{for bit '0'} \end{cases} \quad (6)$$

For bit '1', substituting Eq. (5) in Eq. (4) and using Eq. (6), we obtain,

$$P_0 \cos^2 \left[ \frac{m(t)\pi}{V_\pi} - \frac{V_{bias}\pi}{2V_\pi} \right] = P_0$$

$$\frac{V\pi}{V_\pi} - \frac{V_{bias}\pi}{2V_\pi} = j\pi, \quad j = 0, \pm 1, \pm 2, \dots \quad (7)$$

Similarly, for bit '0',

$$P_0 \cos^2 \left[ \frac{m(t)\pi}{V_\pi} - \frac{V_{bias}\pi}{2V_\pi} \right] = 0$$

$$\frac{-V\pi}{V_\pi} - \frac{V_{bias}\pi}{2V_\pi} = \frac{l\pi}{2}, \quad j = 0, \pm 1, \pm 3, \dots \quad (8)$$

Subtracting Eq. (8) from Eq. (7), we find,

$$V = \left( j - \frac{l}{2} \right) \frac{V_\pi}{2} \quad (9)$$

Addition of Eqs. (7) and (8) leads to,

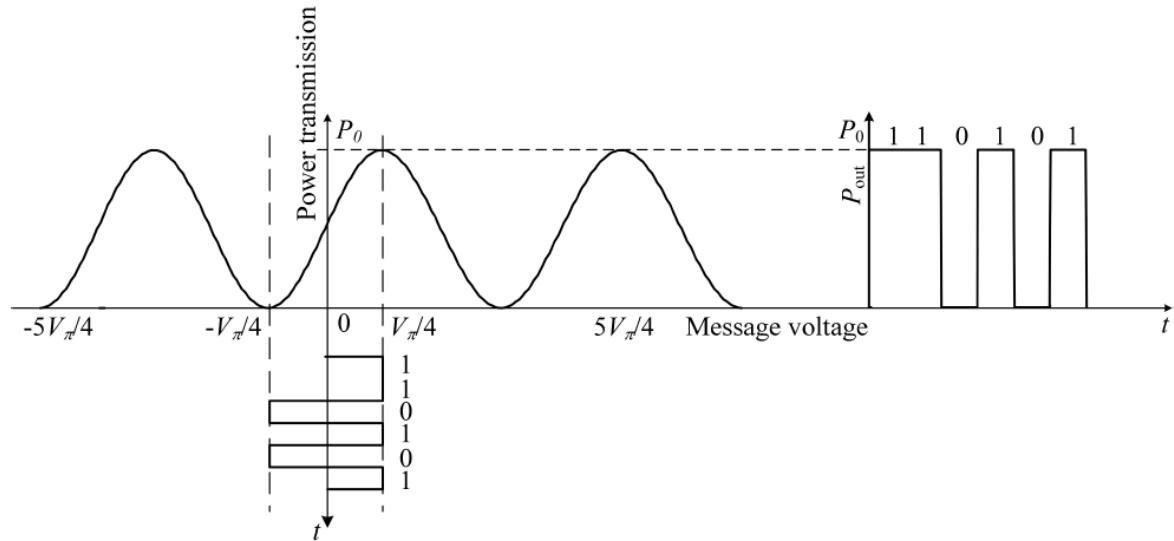

$$V_{bias} = - \left( j + \frac{l}{2} \right) V_\pi \quad (10)$$

If we choose  $j = 0$  and  $l = -1$ , we find,

$$V = \frac{V_\pi}{4} \quad (11)$$

$$V_{bias} = \frac{V_\pi}{2} \quad (12)$$

Thus, polar NRZ in electrical domain becomes unipolar NRZ in optical domain, as shown in Fig. 2. The process of modulation can be visualized using Fig. 3. When  $V = V_\pi/4$  corresponding to bit '1', the constructive interference occurs and MZM power transmission is at its peak. When  $V = -V_\pi/4$ , the destructive interference occurs and MZM power output is zero.

**Figure 3.** Power transmission function of the MZM.  $V_{bias} = V_\pi/2$ .

### 0.0.1 Phase Shift Keying (PSK)

The optical field envelope of the MZM output can be written as (Eq. (2)),

$$A_{\text{out}} = A_0 \cos \left[ \frac{m(t)\pi}{V_\pi} - \frac{V_{\text{bias}}\pi}{2V_\pi} \right] \quad (13)$$

Let the message signal be a polar NRZ given by Eq. (5). The desired field envelope of the Mach-Zehnder output is,

$$A_{\text{out}} = \begin{cases} +A_{\text{out}} & \text{for bit '1'} \\ -A_{\text{out}} & \text{for bit '0'} \end{cases} \quad (14)$$

For bit '1', substituting Eq. (5) in Eq. (13) and using Eq. (14), we obtain,

$$A_0 \cos \left[ \frac{V\pi}{V_\pi} - \frac{V_{\text{bias}}\pi}{2V_\pi} \right] = A_0$$

$$\frac{V\pi}{V_\pi} - \frac{V_{\text{bias}}\pi}{2V_\pi} = 2j\pi, \quad j = 0, \pm 1, \pm 2, \dots \quad (15)$$

Similarly, for bit '0', we have,

$$A_0 \cos \left[ \frac{-V\pi}{V_\pi} - \frac{V_{\text{bias}}\pi}{2V_\pi} \right] = -A_0$$

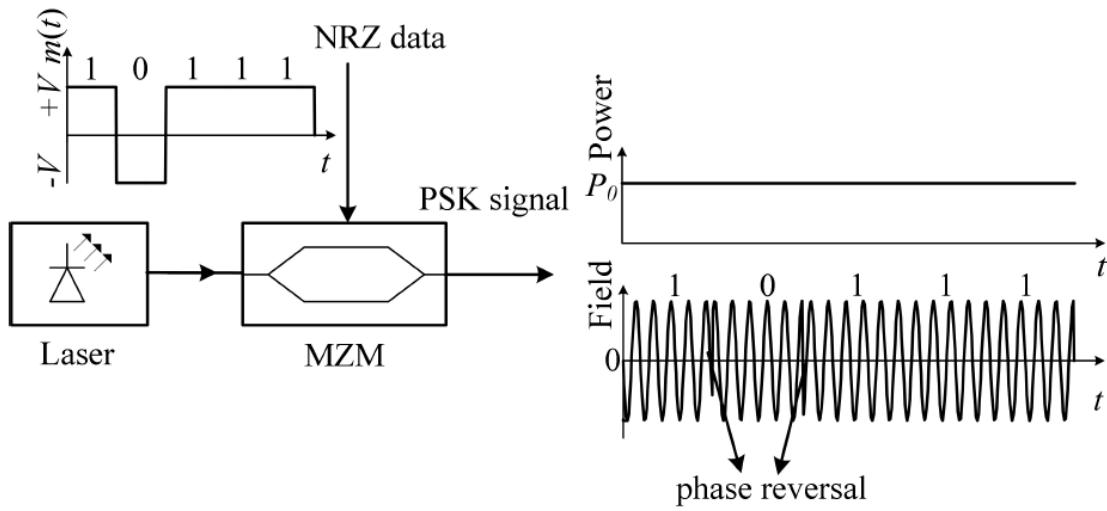

$$\frac{-V\pi}{V_\pi} - \frac{V_{\text{bias}}\pi}{2V_\pi} = (2l + 1)\pi, \quad j = 0, \pm 1, \pm 2, \dots \quad (16)$$

Simplifying Eqs. (15) and (16), we obtain,

$$V = \frac{[2(j-1) - 1]V_\pi}{2}$$

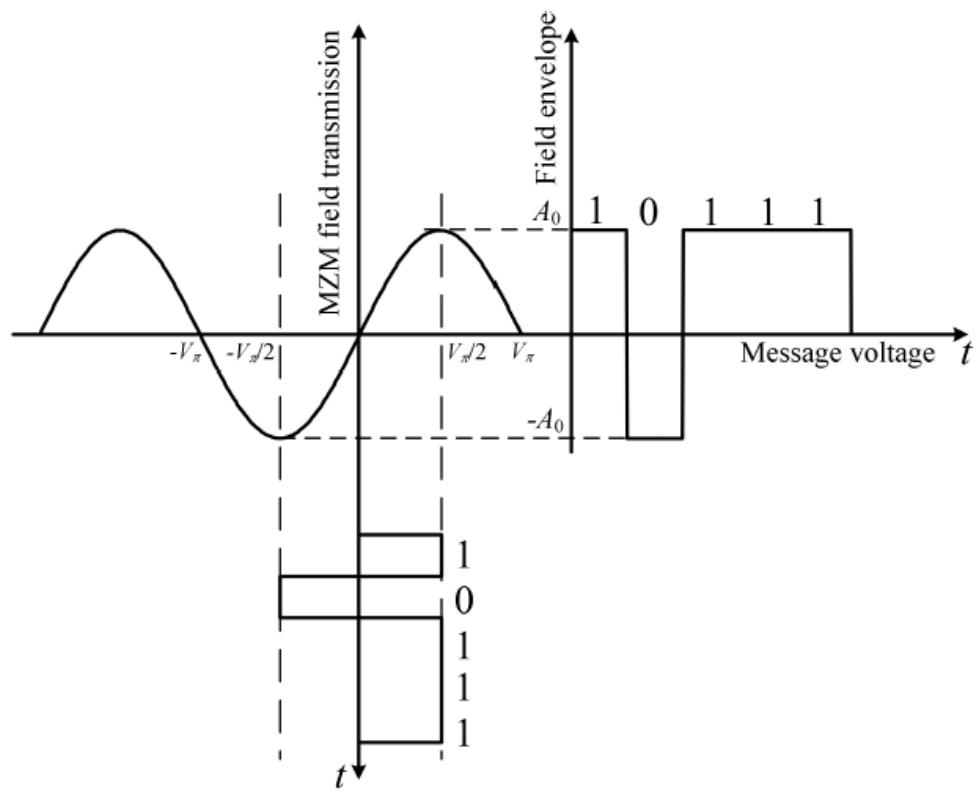

$$V_{bias} = -[2(j+1) + 1]V_\pi \quad (17)$$

If we choose  $j = 0$  and  $l = -1$ ,  $V = V_\pi/2$  and  $V_{bias} = V_\pi$ . Fig. 4 shows the schematic of the PSK signal generation. Fig. 5 shows the MZM field transmission as a function of message signal  $m(t)$ . When the message signal  $m(t) = +V_\pi/2$ , the field transmission is maximum and when  $m(t) = -V_\pi/2$ , it is minimum. Note that the field envelope is negative ( $\pi$  phase) for bit '0' and it is positive (0 phase) for bit '1'. However, the power which is the absolute square of the field remains constant for both bit '0' and bit '1'.

**Figure 4.** Generation of optical PSK signal.

The PSK with NRZ rectangular pulses is a constant power signal and there is a reversal of phase at the bit boundaries when the data changes from '0' to '1' and vice versa.

**Figure 5.** MZM field transmission.  $V_{bias} = V_\pi$ .

## **Company Researchers & Developers**

**Integrate the Modules with your in-house and Commercial Software & Hardware Products**

- (1) Modify the Source Code Modules / Components to the Next Level for Your Research Papers, Research Projects and Theses.
- (2) Integrate Different Source Code Modules / Components in the OCSim Package to Realize Your Own Fiber Optic Communication Systems.
- (3) Use the Existing Source Code Modules / Components for Your Research Papers, Research Projects and Theses.
- (4) Use the Existing Source Code Modules for Laboratory Simulation Experiments and Exercises.

# Simulation of OOK Optical Transmitter with MZM

## Source Code File

**Main File :** Optical\_tx\_psk.m

NRZ-PSK transmitter that uses dual drive Mach-Zehnder modulator (MZM) is simulated. The MZM is driven by polar NRZ signal. The pulse shape is assumed to be raised cosine.

**The main file calls the following functions:**

**power\_meter.m:** calculates the average optical power in dBm units

**tx\_nrz\_psk.m:** Modulates the output of the laser with PSK data using a dual drive Mach-Zehnder modulator. This function is also used to generate QPSK signal by modulating the laser light by in-phase/quadrature component (each component is PSK) of QPSK data.

**eye\_diagram.m:** plots the eye diagram of the optical power.

**Explore Further this Module:**

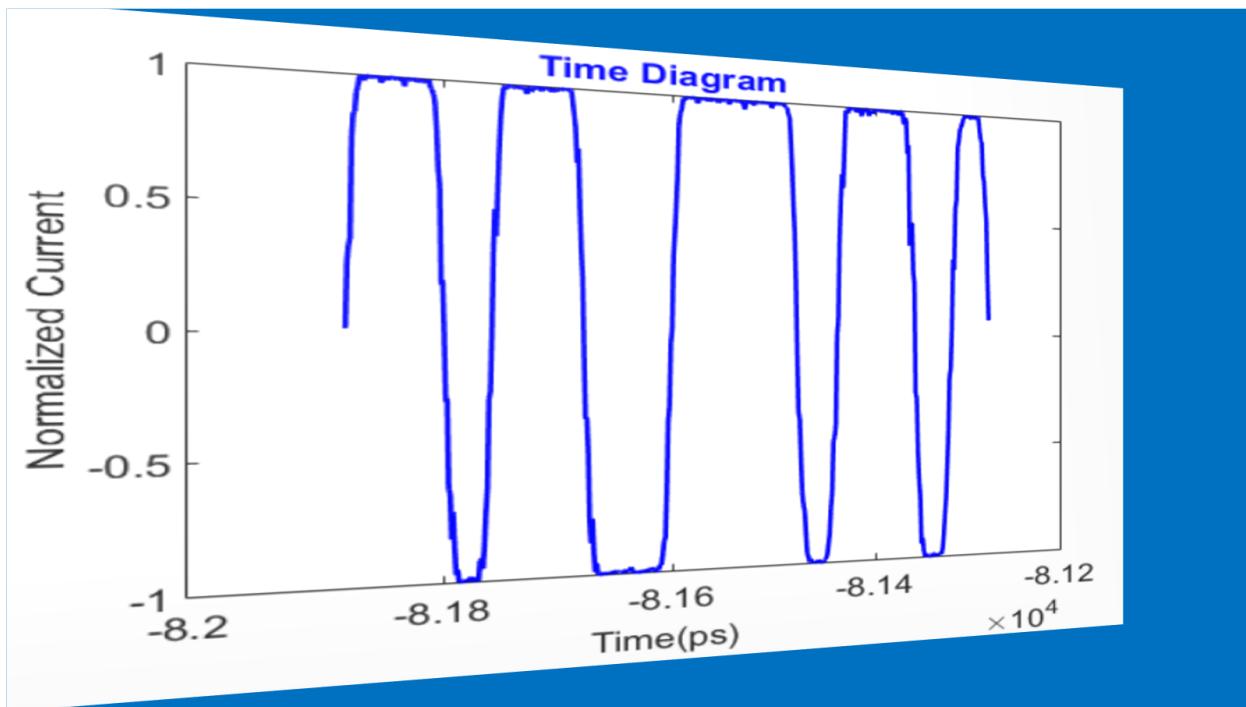

**1. Modify** the code by changing the roll-off factor, alpha from 0 to 0.9 with a step of 0.1 and plot the time diagram, eye diagram and spectrum.

**2. Change** the variances of transmitter electronic noise and optical noise and **observe** how the eye diagram provides the visual information about the noise.

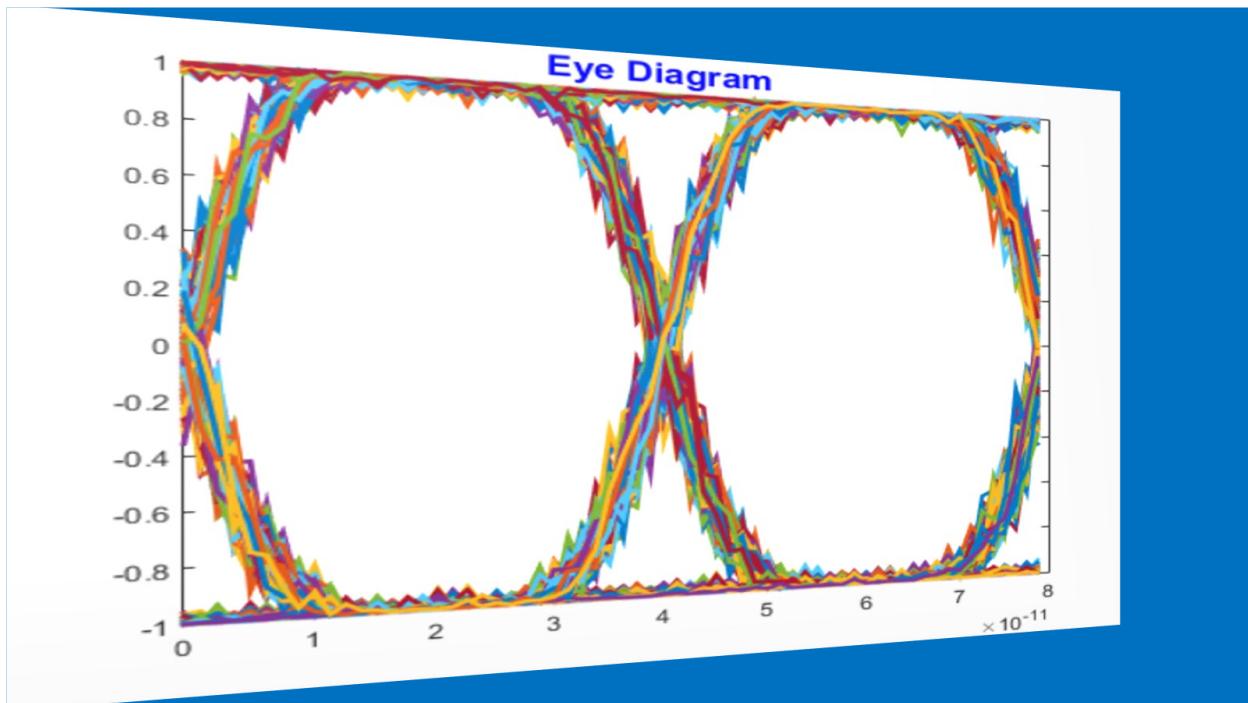

Also **observe** how the noise floor in the spectrum increases as optical and/or electronic noise variance increases.

## Selected Simulated Results Using this Module

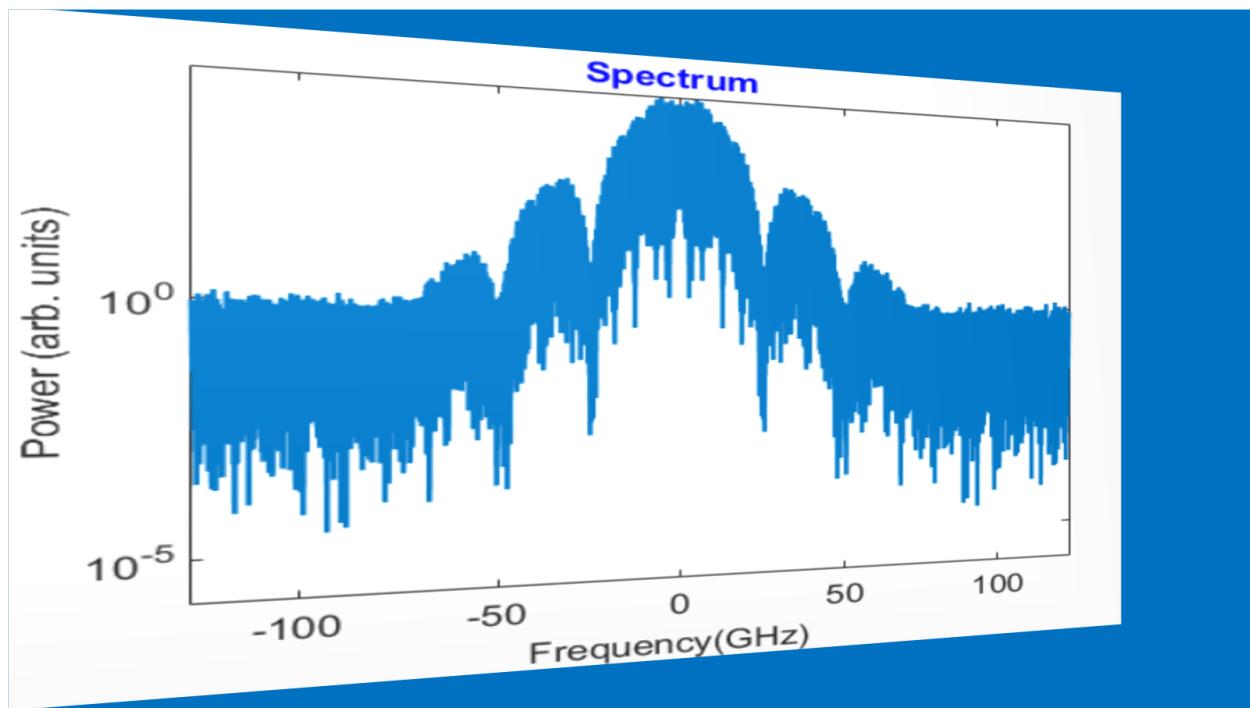

Time Diagram

## Eye Diagram

## Spectrum
